Pre-registration

Results and Discussion

Across all 100 sessions, participants correctly identified the future position of the erotic pictures significantly more frequently than the 50% hit rate expected by chance: 53.1%, t(99) = 2.51, p = .01, d = 0.25. In contrast, their hit rate on the nonerotic pictures did not differ significantly from chance: 49.8%, t(99) = -0.15, p = .56. This was true across all types of nonerotic pictures: neutral pictures, 49.6%; negative pictures, 51.3%; positive pictures, 49.4%; and romantic but nonerotic pictures, 50.2%.

Distinguish confirmatory from exploratory analyses

HARKing: Hypothesizing After the Results are Known

Norbert L. Kerr

Department of Psychology Michigan State University

When exploring data, you can perform a hypothesis test, but you can not test a hypothesis.

De Groot, 1956

You can't test a hypothesis on the data used to generate it.

De Groot, 1956

1) Justify your sample size (stopping rule)

2) Specify IV and DV for each test.

3) Describe the analysis plan (α, data cleaning)
